Tripods on the Range

To use the Shooting Data system with the *Multi-Pull* it is necessary to install on each tripod of the **EP096AT** series some wifi modules model **EP096RFID**.

These modules are able to communicate with the **EP095M** control unit via wifi.

This, in turn, sends to the Data Concentrator the information on the performances of the Athletes, who then, via a modem connected to the Club WiFi network, reach the Beretta Cloud.

The configuration used to integrate the Shooting Data into the *Multi-Pull* System is such that no special changes to the wiring of the shooting range are required. It is sufficient to integrate the **EP096 RFID** wifi modules on the tripods and equip the **EP095M** control unit with a WiFi connection if it does not have one by inserting the appropriate module.

All this represents a considerable economic saving in the installation phase.

The functioning of the system is completely automatic, as long as an Athlete identifies himself with his personal **tag**, the Beretta Cloud will receive the data relating to his performances in real time.

The *Multi-Pull* management software is also compatible with the Beretta system and through it you can view the information that will be sent to the Cloud.
